Abstract

Concerns over the declining standard of mathematics have been expressed by the academic communities in most countries in the world. One of the main factors that bring this about is believed to be the declining interest in the subject among the pupils which in turn is brought about by the lack of awareness about the importance of the subject among the community at large. In this presentation we will discuss the probable causes that contribute towards the low level of awareness and view a number of ways that has been implemented to arrest the decline of interest in the subject.
